

Module One Project: Accumulate test score data

For this project, you'll create a form that accepts scores from the user, displays the total, count, and average of the scores, and displays a dialog box that lists the scores.

The design of the Score Calculator form and the Sorted Scores dialog box

Operation

- The user enters a score and clicks the Add button or presses the Enter key.
- The application calculates and displays the score total, score count, and average score.
- If the user clicks the Display scores button, the application sorts the scores and displays them in a message box.
- If the user clicks the Clear scores button, the application removes all the scores and clears the score, score total, score count, and average controls.

Specifications

- This application should check the number entered by the user to make sure it is a valid integer from 0 to 100.
